RStudio

Introduction to R for Public Health Researchers

Working with R

- ► The R Console "interprets" whatever you type
 - Calculator
 - Creating variables
 - Applying functions
- "Analysis" Script + Interactive Exploration
 - Static copy of what you did (reproducability)
 - ▶ Try things out interactively, then add to your script

R essentially is a command line with a set of

functions loaded

R Uses Functions, in Packages

- R revolves around functions
 - Commands that take input, performs computations, and returns results
 - When you download R, it has a "base" set of functions/packages (base R)
- Functions are enclosed in packages
 - ► These written by R users/developers (like us) some are bad
 - ▶ Think of them as "R Extensions"

Using Packages

- ➤ You **need to know base R** answers on Google commonly use it
- We will show you some newer and more intuitive ways to do things, not in base R
- ► RStudio (the company) makes a lot of great packages
- Hadley Wickham writes a lot of them (Employee and Developer at RStudio)
 - One authority on all things R
 - How to trust an R package: http://simplystatistics.org/2015/ 11/06/how-i-decide-when-to-trust-an-r-package/

RStudio (the software)

RStudio is an Integrated Development Environment (IDE) for R

- It helps the user effectively use R.
- Makes things easier
- Is NOT dropdown statistical tools (such as Stata)
 - See Rcmdr or Radiant.
- All snapshots in these slides are taken from http://ayeimanol-r.net/2013/04/21/289/

RStudio

Easier working with R

- ► Syntax highlighting, code completion, and smart indentation
- Easily manage multiple working directories and projects

More information

- Workspace browser and data viewer
- Plot history, zooming, and flexible image and PDF export
- ▶ Integrated R help and documentation
- Searchable command history

RStudio/R Console

RStudio/R Console

- Where code is executed (where things happen)
- ▶ You can type here for things interactively
- Code is **not saved** on your disk

RStudio Layout

If RStudio doesn't look like this (or our RStudio), then do:

RStudio -> Preferences -> Pane Layout

Source/Editor

Source

- Where files open to
- Have R code and comments in them
- Can highlight and press (CMD+Enter (Mac) or Ctrl+Enter (Windows)) to run the code

In a .R file (we call a script), code is saved on your disk

Workspace/Environment

Workspace/Environment

- ► Tells you what **objects** are in R
- ▶ What exists in memory/what is loaded?/what did I read in?

History

- Shows previous commands. Good to look at for debugging, but don't rely on it as a script. Make a script!
- Also type the "up" key in the Console to scroll through previous commands

Other Panes

- Files shows the files on your computer of the directory you are working in
- ▶ Viewer can view data or R objects
- ▶ **Help** shows help of R commands
- Plots pretty pictures
- Packages list of R packages that are loaded in memory

Useful R Studio Shortcuts

- Ctrl + Enter (Cmd + Enter on OS X) in your script evaluates that line of code
 - It's like copying and pasting the code into the console for it to run.
- Ctrl+1 takes you to the script page
- ► Ctrl+2 takes you to the console
